

HYDREMA 922D

Four of AJK Plant Hire's Hydrema 922 ADTs clearly demonstrated their specialist earth moving capabilities at the new Salford Reds Rugby Club site works near Barton Bridge, Manchester.

The ground conditions were very soft and water logged in many areas, which made it impossible for other makes and models of 6 wheeled 25 tonne dumpers to work.

Working as a team of four, the Hydrema 922s with their unique weight distribution and extra wide 800mm tyres travelled effortlessly across the terrain, passing the other already abandoned and parked-up standard 25 tonne trucks in their wake.

The ground bearing pressure of just 11.9 psi ensured the 922s didn't get stuck in the adverse conditions. The trucks were even able to keep running in the snow and ice. The site contractors were able to continue works and adhere to time scales due to the Hydremas being able to work.

The fuel consumption was also a notable factor for the works too. The 922 uses only 14 litres (3 gallons) per hour. In today's climate this is a favourable point to consider and was another positive feature for the site contractors.

The 922s unique low ground pressure capability and impressive fuel economy make it a very environmentally friendly machine to use. Very little soil and land disturbance occur to the ground that the 922 travels over, making it a preferred choice of machine for many users in which minimal ground damage is a necessity. Such sites can include nature reserves, lake and riverside works, agricultural estates and sites of special scientific interest (SSSI's)

Indeed, 922s can travel across agricultural land and leave minimal evidence they were there.

To enhance the 922s environmentally friendly features it can use Bio-oil as an option.

The 922 is just as at home on conventional sites too. With its 22 tonne carrying capacity, the 922 is able to move large amounts of material in one load. The 922 can travel quickly across site for its size too, maximising the number of loads transported in a days work. This makes the truck an ideal contracting tool in which time constraints and costings are a key element to the success of the job. The 922 has the added benefit of low ground pressure, enabling it to continue to work to its maximum even if conditions deteriorate.

To summarise, the Hydrema 922 is unique among its 25 tonne contemporaries due to its low ground pressure features and capabilities.

It is a machine well worth considering as an alternative to standard 25 tonne trucks and/or larger Tracked Dumpers available today.

922C

TECHNICAL DATA:

- Carrying capacity 22 tonnes
- Ground pressure 11.9 psi
- Fuel consumption 14 litres (3 gallons) per hour
- Total Width 3290 mm
- Max height 3330 mm
- Overall length 8980 mm
